< Target Use Case: TRAVEL

Currently, Google Maps optimizes navigation routes for all transportation modes based on the **quickest and most economic path** a person can take to get to their destination.

However, as a navigation app, implementing **safety** features should be a high priority for its users.

“

As a user of Google Maps, I would like the option to select the safest route to a destination because I want to have more flexibility in choosing routes and feel safer while traveling

Occasionally infuriating. Google maps, *please please please* give options to avoid certain routes or choose what kind of vehicle you are in!!!

Unsafe directions!! Directions given to my girlfriend were a very long way having her cross over train tracks and walk by strip clubs...I would think that Google Maps would give you safe directions.

Great app. Please add “Safest Route” in addition to “Fuel Efficient Option.” I suggest adding a “safest route” option, allowing drivers to navigate on roads with fewer accidents and fatalities

Mockups

Possible Solutions

- Suggest routes with more traffic, avoiding windier and lower populated roads
- Integrate with crime tracking app APIs to supply real-time crime activity, like Citizen
- Allow users to draw out specific sections of the map to avoid

Mockups

Prioritization

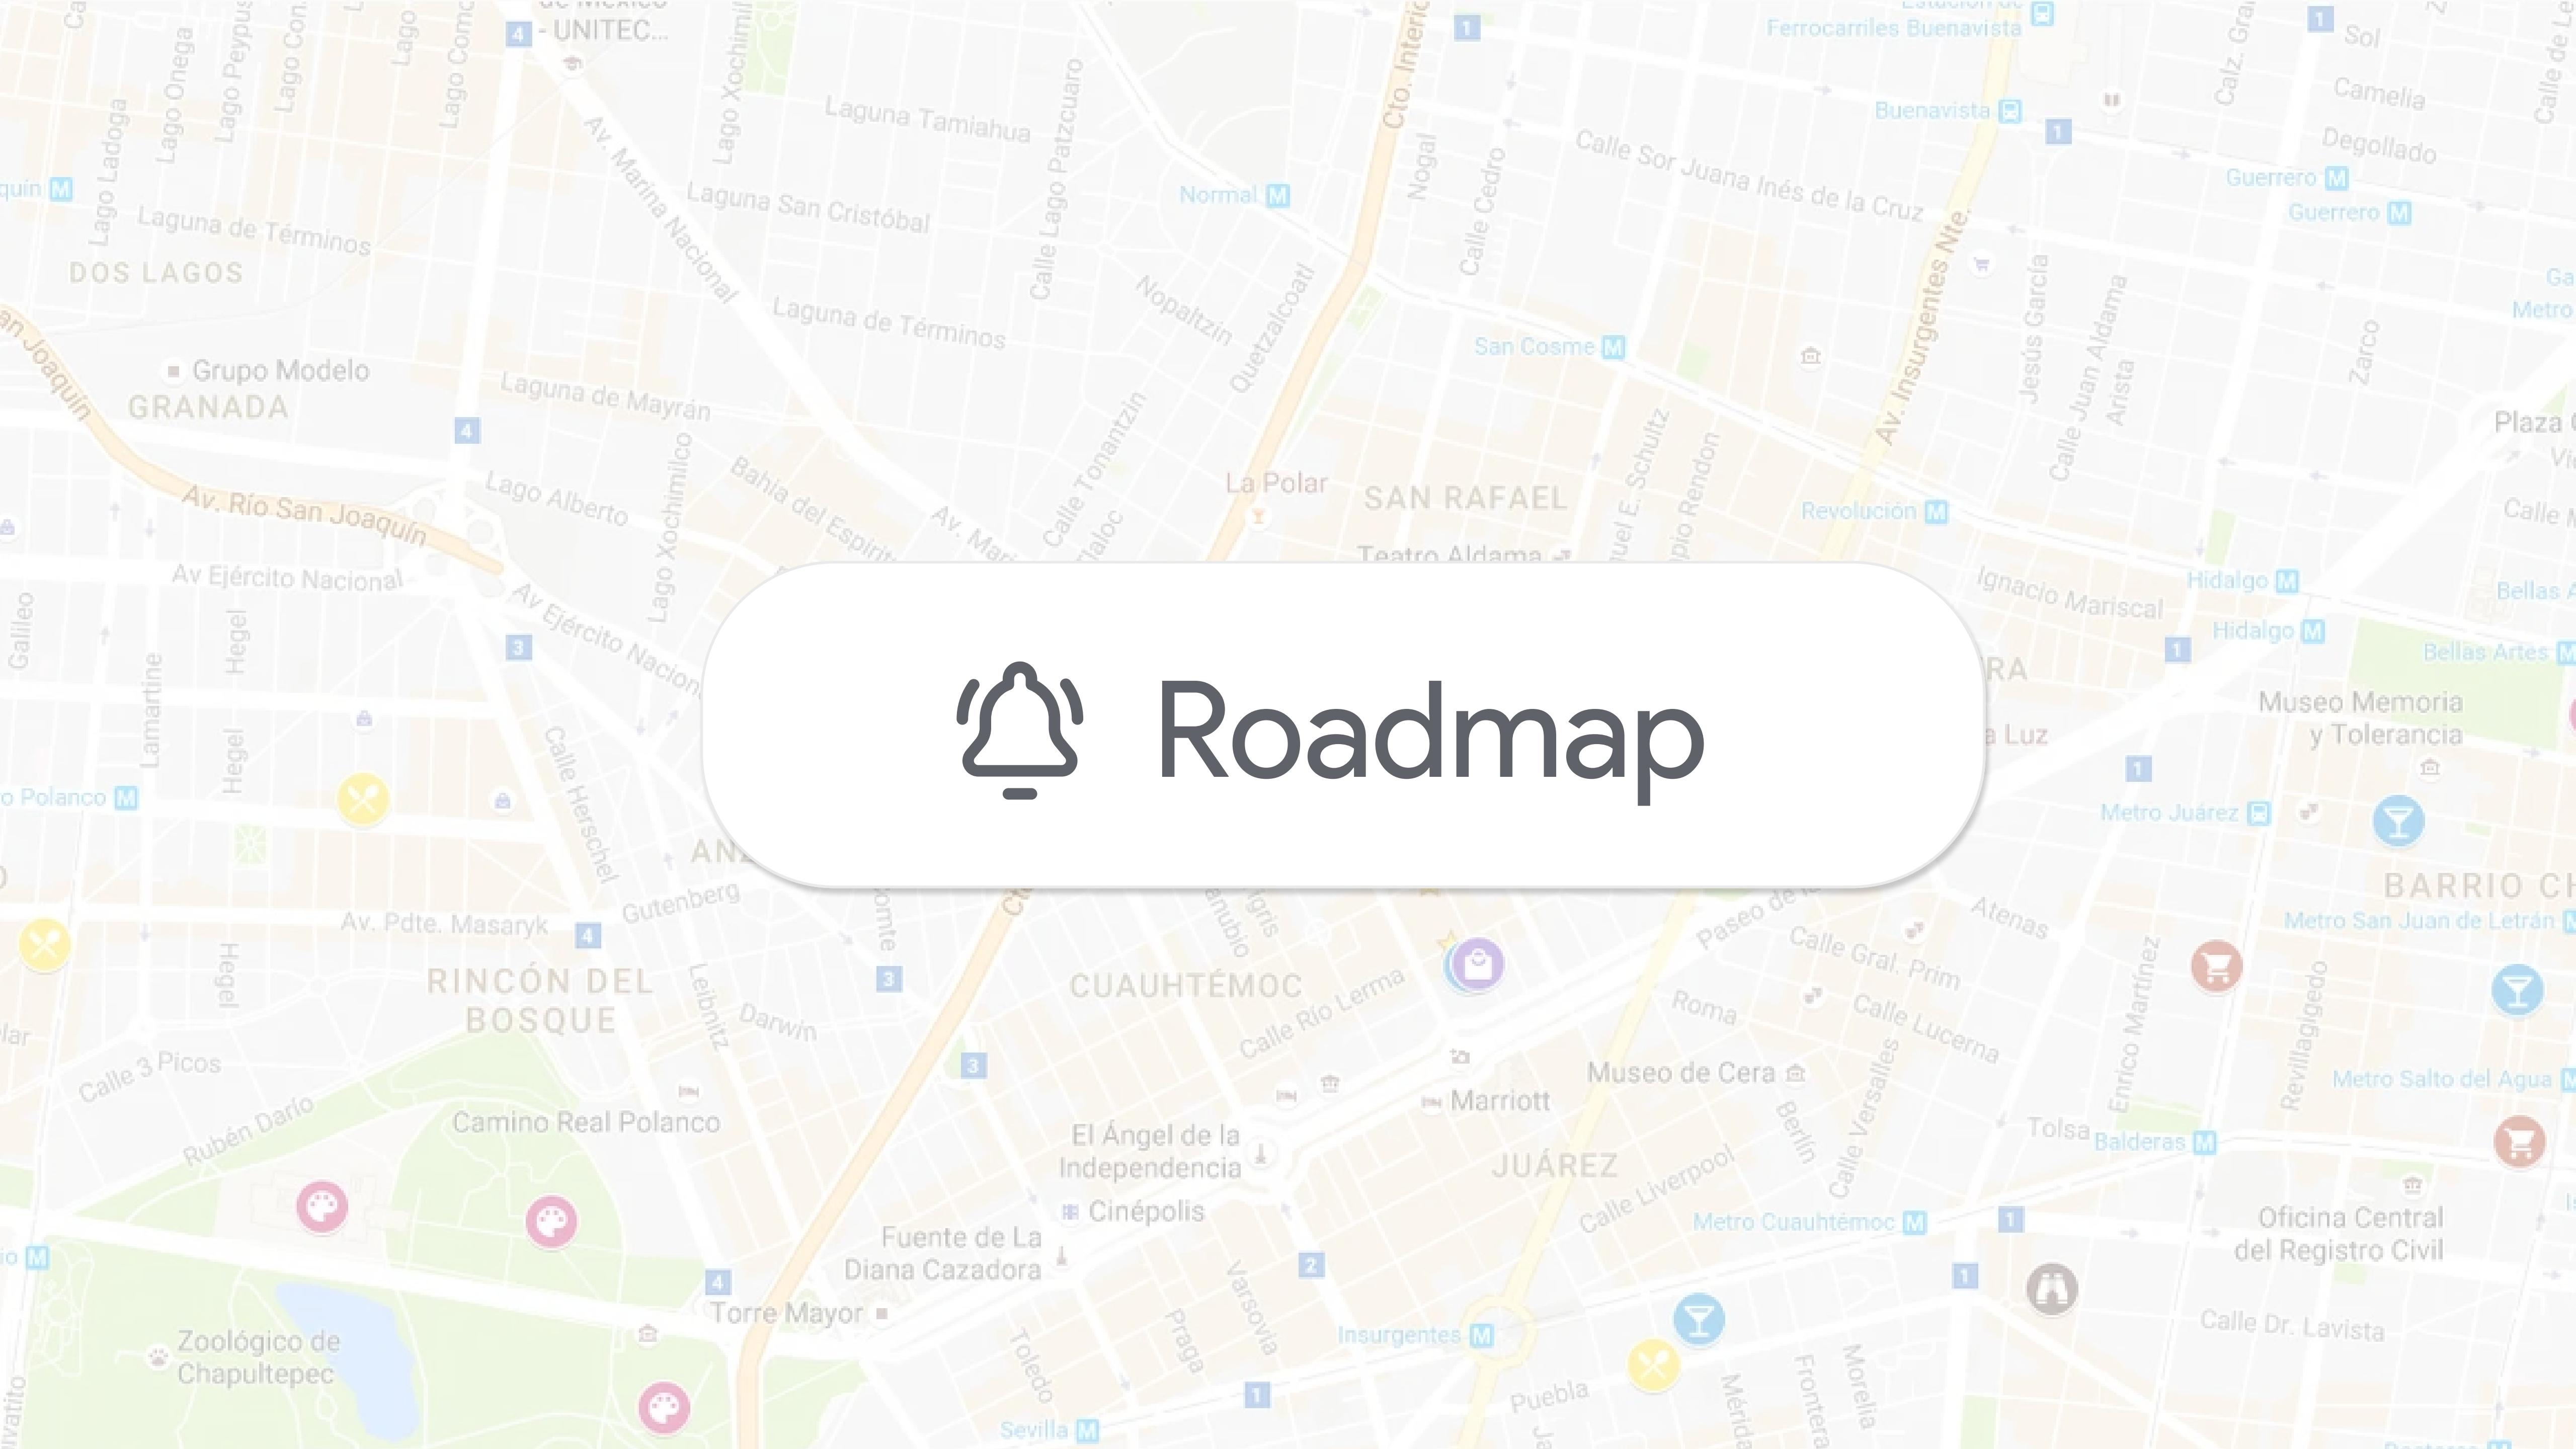

- Suggest well-travelled roads, avoiding windier and lower populated roads
- Intuitive
 - Uses in-house data
 - Needs trial and error to avoid increasing travel times significantly

- Integrate with crime tracking app APIs to supply real-time crime activity, like Citizen
- Keeps users on Google Maps over crime tracking apps
 - Does not require much engineering effort
 - APIs may not be available = not possible

- Allow users to draw out specific sections of the map to avoid
- Allow for greater user customization
 - Not intuitive across platforms
 - Not seamless
